NITROGEN TIRE INFLATION SYSTEM ADDS EFFICIENCY HITS CLAIMS MILESTONE

The NitroFill Automatic Multiple Tire Inflation system is capable of inflating or deflating up to six tires simultaneously at the touch of a button and works without lifting the vehicle or removing the tires or valves.

Suitable for any nitrogen inflation or conversion, the nitrogen tire inflation system checks and corrects pressure instantly so no other gauges or inflators are necessary and is fully programmable from 3 psi to 145 psi. A microprocessor ensures accuracy plus or minus 3 psi.

NitroFill is virtually maintenance free – having to replace the filter elements just once a year – and can be installed in less than 30 minutes by simply placing it where you want connecting a compressed air line and installing your nitrogen airline/chuck.

It is also completely portable, comes with a rechargeable long-life battery, four 26' hoses and self-locking chucks, and has a backlit

analog screen with graphic and audible indicators.

According to the company, filling tires with nitrogen is better than with regular air because it is inert, non-combustible and non-corrosive. When a tire is manufactured and exposed to air the effects of "oxidation" begin to deteriorate the rubber, which causes it to lose elasticity and strength over time. When tires are inflated with air, therefore, the oxygen attacks the rubber molecules, working from the inside out, until the oxygen, and its destructive properties, permeates the tire structure and ultimately the tread.

Nitrogen can also help extend tire life by up to 20 percent and helps prevent corrosion, overheating, pressure increase from heat build up and uneven wear from improper inflation.
